"The average price of gasoline in the U.S. hasn't been this low in March since 2021, when the pandemic significantly reduced demand and

kept prices suppressed. This time around, caution is also playing a  role in keeping prices lower— particularly uncertainty over tariffs, which is likely having a moderate impact," said Patrick De Haan, head of petroleum analysis at GasBuddy. "Concerns about the direction of the economy could have a major influence on fuel prices in the months ahead, especially with the high level of uncertainty surrounding tariffs. Additionally, OPEC+ announced last week that it would gradually begin restoring oil production after nearly two years of cuts, adding further downward pressure on oil prices. As a result, the typical seasonal rise in gas prices has yet to materialize, and if and when it does, it may be considerably smaller than expected."
